Notes:

- 1. For the AS capacity (Column G), it was assumed that the Single Largest Contingency (SLC) was SMUD's Cambells Soup plant, 44% of which is assigned to Western, 40 MW of which is the spin requirement; or a transmission constraint on Western's system (80 MW). The capacity reservation was calculated as 40 MW spin for the SLC plus 40 MW for regulation. It was assumed that 52% of the total
- Base Resource in any hour will reside in the ISO area.

 2. An average of 1.81 % losses would be assessed on both capacity and energy between generation and load.
- 3. Column Q denotes capacity at CVP plants with minimal energy (potentially useful for reserves.).
- 4. CVP Corp transactions (in monthly energy and equivalent capacity) were included to reflect a target of \$4.537 million in the CVP Corp account at the end of the fiscal year. A 3 GWh planning margin is added to each month when receiving energy from CVP Corp. Timing and amount of transactions are subject to change.

 5. CVP generation and Project Use data for 50% and 90% Exceedence Levels are derived from USBR January 21, 2005 50% and 90% Exceedence water forecasts, respectively.
